

Moon Landing location puzzle

By Josiah Schwab

Each row contains four cards, three of which form a valid set (as in the game Set). Each combination of number, color, and shape represents a letter or space. There are 27 possible cards in total. To figure out what is represented by each card, note that the sets of cards are always presented following the same overall order. The flavortext “space begins” clues that the first card in the order is a space.

Identify the odd card out in each row and convert it into a letter or space.

The answer, explaining what the BACKDROPS are, is **KUBRICKS MATTE PAINTINGS**.
